The diaphragm is a sheet of skeletal muscle that has to contract and relax for you to breathe day and night. If you recall from your study of the skeletal system and joints, body movement occurs around the joints in the body. The focus of this chapter is on skeletal muscle organization.

Introduction to the Muscular System ¦ Anatomy and Physiology I
Summary of Muscular system anatomy and physiology The main types of muscle tissue are: skeletal, cardiac and smooth muscles. Skeletal muscles can be moved voluntarily and are important for maintaining body temperature, by generating heat. The cardiac muscle is present only in the heart and can contract without neural stimulation.

As a body system, the muscular system serves different important functions for man ' s survival. Through the skeletal muscles, this system maintains the posture of an individual, as well as initiate, continue and stop body movement. With the smooth muscles, digestion of food is made possible even without conscious thought.

Anatomy And Physiology: Muscular System
To move the skeleton, the tension created by the contraction of the fibers in most skeletal muscles is transferred to the tendons. The tendons are strong bands of dense, regular connective tissue that connect muscles to bones. The bone connection is why this muscle tissue is called skeletal muscle. Interactions of Skeletal Muscles ¦ Anatomy and Physiology I
The skeletal muscle ' s anatomical location or its relationship to a particular bone often determines its name. For example, the frontalis muscle is located on top of the frontal bone of the skull. Similarly, the shapes of some muscles are very distinctive and the names, such as orbicularis, reflect the shape.
