Glycolysis The Krebs Cycle Pogil

Glycolysis will occur in a cell with or without oxygen present. If oxygen is present, the link reaction, Krebs cycle, and oxidative phosphorylation will complete the process of oxidizing glucose and maximizing the energy output.

Glycolysis and the Krebs Cycle - Weebly

Glycolysis and the Krebs cycle. Quick revise. Both processes produce ATP from substrates but the Krebs cycle produces many more ATP molecules than glycolysis! Every stage in each process is catalysed by a specific enzyme. In aerobic respiration both glycolysis and the Krebs cycle are involved whereas in anaerobic respiration only glycolysis takes place.

Glycolysis – It is an anaerobic process, which occurs in the cytoplasm of the cell. In glycolysis, partial oxidation of glucose occurs, which yields two molecules of pyruvic acid. Krebs Cycle – It is an aerobic process that takes place in the mitochondria of the cell. It gives Carbon dioxide after complete oxidation of pyruvic acid formed during glycolysis.
